Python for Data Science Practical

Practical - III

Roll No. : S003	Name: Aryan Raj
Class : SYIT	Batch : -
Date of Assignment : 29-07-26	Date/Time of Submission : 29-07-26

PART – A: Theory

Python provides built-in modules to work with **date**, **time**, and **calendar**. These modules help programmers display the current date, convert timestamps into readable dates, generate calendars, and compare dates. They are widely used in attendance systems, scheduling applications, event management, and report generation.

1. Working with Date and Time (**datetime** Module)

The `datetime` module provides classes to work with dates and time. It allows us to get the current date and time, format them, and perform calculations.

Syntax:

```
from datetime import datetime
today = datetime.now()
```

Explanation:

- `from datetime import datetime` imports the `datetime` class.
- `datetime.now()` returns the current system date and time.

2. Working with Timestamps (**time** Module)

A timestamp is the number of seconds elapsed since **January 1, 1970 (Unix Epoch)**. The `time` module converts timestamps into a readable date and time.

Syntax:

```
import time
time.ctime(timestamp)
```

Explanation:

- `ctime()` converts a timestamp into a human-readable date and time.

3. Displaying a Calendar (`calendar` Module)

The `calendar` module is used to display monthly and yearly calendars in Python.

Syntax:

```
import calendar
calendar.month(year, month)
```

Explanation:

- `month()` displays the calendar for a given month and year.
- `calendar()` displays the complete calendar for a year.

4. Comparing Two Dates

Python allows comparison of dates using comparison operators or by calculating the difference between dates.

Syntax:

```
date1 > date2
date2 - date1
```

Explanation:

- `>` checks which date is later.
- `-` returns the difference between two dates.

PART – B Questions:

a. Write a python code to print current date in different format.

Code:

```
from datetime import datetime

d = datetime.now()

print(d.strftime("%d/%m/%Y"))
print(d.strftime("%d/%B/%Y"))
print(d.strftime("%d-%m-%Y"))
```

Output:

```
===== RESTART
29/07/2026
29/July/2026
29-07-2026
|
```

b. Write a python code to convert time stamp to date stamp.

Code:

```
import time
|
t = time.time()
print(t)
print(time.ctime(t))
```

Output:

```
===== RESTART: D:/S003 Ary
1785314425.2906497
Wed Jul 29 14:10:25 2026
>
```

c. Write a python code to develop calendar module.

Code:

```
import calendar

print(calendar.month(2026,9))
```

Output:

```
----- RESTART: D:/
    September 2026
Mo Tu We Th Fr Sa Su
   1  2  3  4  5  6
  7  8  9 10 11 12 13
14 15 16 17 18 19 20
21 22 23 24 25 26 27
28 29 30
```

d. Write a python code to compare two dates.

Code:

```
from datetime import date

d1 = date(2026,7,29)
d2 = date(2027,5,15)
|
print(d1>d2)
print(d1<d2)
print(d2-d1)
```

Output:

```
===== RESTART: D:.,
False
True
290 days, 0:00:00
```
